

How to organize your code?

By **Type**? By **Feature**? By **Author**?

- Docs, Code, - Plugins - Large projects
- Tests, MVC - Classes - Dependencies

One architecture *does not* fit all

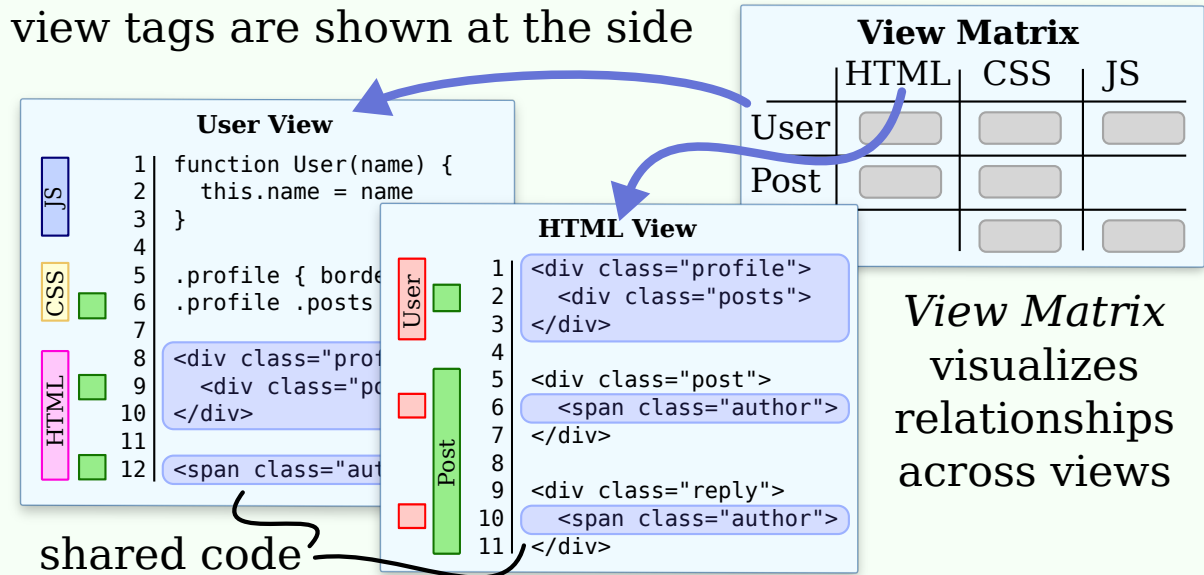

Organized by code type
Disorganized by functionality

Code Views

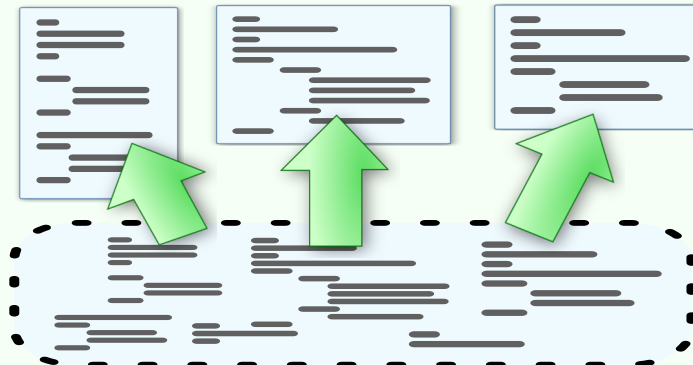

Andy Spencer

User defined *views* instead of files
view tags are shown at the side

Views provide a dynamic way to work with software that does not fit into a single static architecture

Logic Graphics Feature

Functions and code can be included in multiple views.

All code is stored together in a shared *code pool*
